Retail Sales Analytics Dashboard

Analyst Summary (validated against source workbook) | 100,000 orders | 2019–2023 | India

1. Executive Summary

The workbook holds 100,000 order lines (one per order, no duplicates, no missing values in the core fields) spanning 2019–2023, 4 regions, 10 states, 3 city tiers, 3 outlet sizes, 2 segments, 6 product categories and 24 sub-categories. The business generated total sales of 2,508.44M and profit of 375.53M, a 14.97% margin, on 549,376 units at an average order value of 25,084.

Performance is remarkably even. Segment, outlet size, city tier, region, category and ship mode all land within about 1–4% of each other. The real levers in the data are discounting (margin falls from about 19% to about 11% as discounts rise) and a small softening of sales since 2021. Region, category or segment choices matter far less.

2. Headline KPIs

Metric	Value	Comment
Total Sales	2,508.44M	About 502M per year
Total Quantity	549,376 units	Average 5.5 units per order
Total Profit	375.53M	About 75M per year
Profit Margin	14.97%	14.9–15.0% in every year
Average Order Value	25,084	Median 25,135; range 101 to 50,000

3. Key Findings

Time trend

Year	2019	2020	2021	2022	2023
Sales (M)	503.1	504.2	504.7	498.9	497.5
Profit (M)	75.5	75.4	75.4	74.8	74.5

- Sales peaked in 2021 (504.7M) and fell about 1.4% by 2023 (497.5M), with profit following (75.5M to 74.5M). The decline is small, but it is the only directional movement in the data.

Customer and order mix

- **Segment:** Corporate (1,255.1M) and Consumer (1,253.3M) each hold about 50% of sales, with equal margins.
- **Outlet size:** Large (841.0M, 33.5%) and Medium (840.9M, 33.5%) are level. Small outlets trail slightly (826.5M, 33.0%).

- **Ship mode:** The chart counts orders, not order value: First Class 25,078, Same Day 25,007, Second Class 24,944 and Standard 24,971. Average shipping lag is about 4 days in every mode, so the faster tiers show no speed advantage.

Geography

Region	Sales	City Type	Sales
East	635.3M	Tier 1	844.4M
South	629.1M	Tier 2	835.4M
North	624.5M	Village	828.6M
West	619.6M		

- East leads and West trails by about 2.5%. Villages are only about 2% behind Tier 1 cities.
- **States:** Rajasthan (255.9M), Punjab (254.0M) and Maharashtra (252.4M) lead. Uttar Pradesh is lowest at 245.3M, about 4% below Rajasthan and about 2% below the state average, the largest gap in the geography data.

Products and categories

- **Categories:** Sessional Fruits & Vegetables (419.9M), Household Items (419.8M) and Electric Appliances (418.8M) lead. Furniture is lowest at 414.0M, and its Chairs sub-category is the weakest of all 24 at 99.5M.
- **Mops:** Mops are #1 by both sales (109.6M) and profit (16.4M), about 5% above the average sub-category. Carrots (107.5M sales, 16.1M profit) rank second.
- **Profit leaders:** Mops, Carrots, Microwaves, Burgers and Pizzas make up the top five by profit. The top ten sit in a narrow 15.7M–16.4M band.
- **Margin:** Every sub-category earns 14.8–15.2%, so ranking is driven by sales volume and not by profitability.

Discounting

Discount band	Margin	Sales (M)
0–10%	18.9%	518.5
10–20%	16.9%	502.8
20–30%	14.9%	498.5
30–40%	12.9%	507.6
40–50%	11.0%	481.0

- Discount has a clear negative relationship with profit (correlation about -0.27), while sales stay about 480–520M per band. Deeper discounts are not buying extra sales, which is the strongest actionable insight in the dataset.

4. Conclusion

The business is healthy, profitable and well diversified. It earns a steady 15% margin on about 500M of annual sales, with no region, segment, category or product creating a significant risk or dependency. Differences between groups are small, typically 1–4%, so no single area is a major outperformer or underperformer.

Two points deserve attention. First, sales have eased about 1.4% since the 2021 peak, so growth is the main challenge. Second, discounting is the clearest lever on profitability: margin drops from about 19% to about 11% as discounts deepen, without any matching gain in sales. Uttar Pradesh and the Furniture category are the only visible laggards.

Overall, the dashboard gives a clear and accurate view of overall performance. Adding margin by region and category, discount analysis and growth percentages would make it more useful for decision-making.
